

# **Scenario Planning with Data on Steroids**

# There is No 'New Normal'

*The best leaders and organizations plan for multiple futures and hedge*

*One tool that can assist in scenario planning is Monte Carlo simulation*

*It is scenario planning, with data, on steroids.*

# Supply Chain Disruption

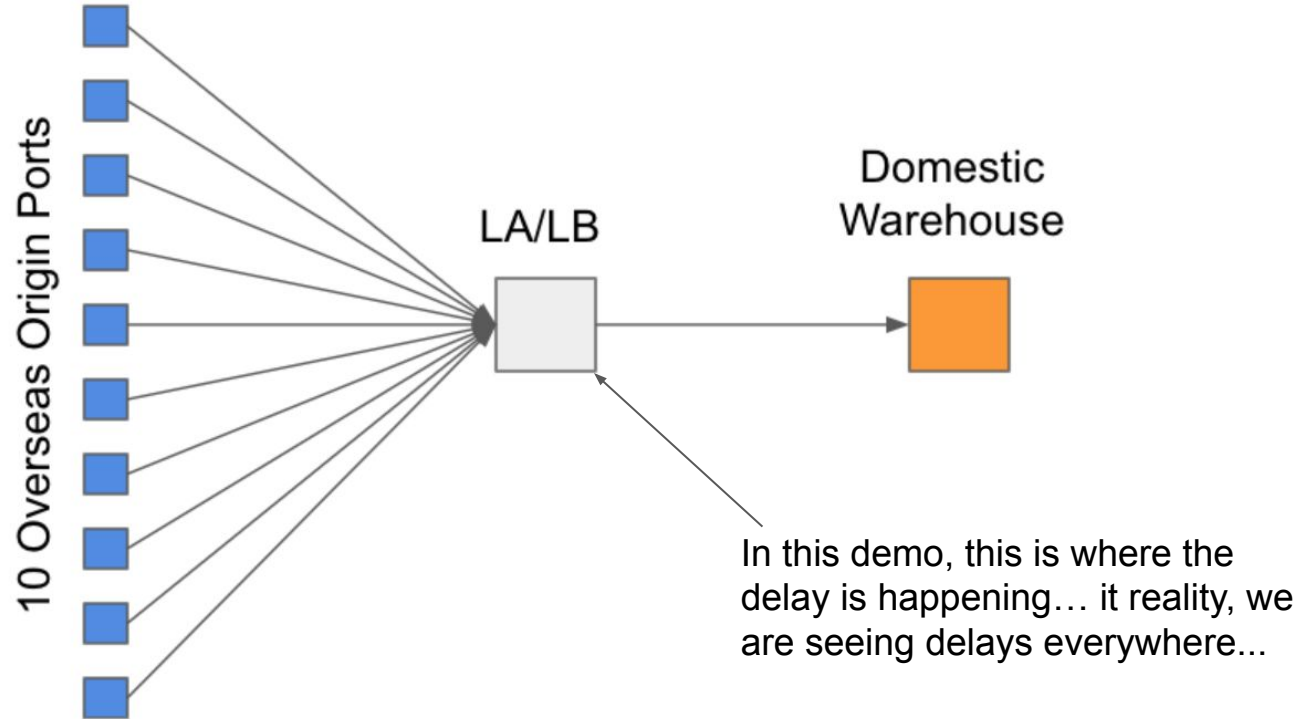

*The ports of LA/LB have faced considerable delays over the past year.*

*In order to estimate the impact of port delays on supply chains we can use MC's.*

*And we can build these MCs with R.*

# The Chain

# Foundational Building Blocks: Distributions

The speed through each component of the supply chain is variable. Each has a distribution of speeds over time.

# Series of Values from Distributions

Transit: Order to  
Overseas Port

Transit: Overseas Port  
to Domestic Port

Transit: Domestic Port to  
Domestic Warehouse

# What does the data look like for a single instance?

	volume	start_date	order_oport	oport_dport	dport_dwhse	the_delay_seq	full_transit	arrival_date
